Venous Thromboembolus (VTE) Prevention & Treatment
Establish risk assessment, prevention, and links to treatment for this complication of hospital care.

Domain
Patient Care Processes:
Clinical processes that ensure delivery of high-quality care to individual patients

Aims
Safe:
Delivery of care in a manner that minimizes any risk of harm to a patient

Process Attributes

Cost to Implement
The monetary resources required to implement this process

Minimal: Just the cost of the improvement effort itself

Time to Implement
The amount of time, from months to years, it will take on average to establish this process

Fewer than 12 months

Difficulty to Implement
The challenges of implementing this process

Moderately Challenging: Either involves multiple units or disciplines OR requires a substantial shift in culture and/or operations, but not both of these

Level of Evidence
The degree to which the actions in this process are supported by research and experience; based on the Cochrane scale

Strong Evidence: Level I or Level II — Studies published using randomized trials

Details

Elements

- Assess all patients on admission for venous thromboembolism (VTE) risk

- Provide appropriate venous thromboembolism (VTE) prophylaxis, including pharmaceutical and mechanical approaches based on national guidelines:
  - Surgical patients with procedures designated in SCIP measures
  - Intensive care ventilated patients as part of the Ventilator Bundle
  - All other patients assessed to be at risk (based on ACCP Guidelines)
Outcomes

- **Mortality (HSMR):** Decreased mortality (hospital standardized mortality ratio, or HSMR)
- **Harm:** Decreased harm to patient (e.g., Harms per 100 patient days, as measured by the IHI Global Trigger Tool)
- **Cost of Care:** Decreased cost per inpatient case
- **Readmissions within 30 Days:** Decreased readmissions within 30 days
- **Reliability:** Increased delivery of evidence-based care 100% of the time

Service Lines and Critical Functions

- Hospital Medicine, Adult
- Surgical

Key Measures

- Percent of patients screened on admission for VTE risk

- **Venous Thromboembolism Discharge Instructions**
  VTE patients with documentation that they or their caregivers were given written discharge instructions or other educational material addressing all of the following:
  - Follow-up monitoring
  - Compliance issues
  - Dietary restrictions
  - Potential for adverse drug reactions/interactions
  - Activity requirements or restrictions

- **Venous Thromboembolism Prophylaxis**
  Percent of patients who received venous thromboembolism (VTE) prophylaxis or have documentation why no VTE prophylaxis was given within 24 hours of hospital admission or surgery end time (medical and surgical inpatients with inpatient stays of >48 hours and >18 years of age)

Reasons and Implications

Importance for Patients and Families
This very serious complication can often be prevented by checking patients for risk of blood clots and then taking steps to prevent them. Reducing VTE decreases the chances of readmissions to hospitals, serious complications, and deaths.

Requirement, Standards, Policies, and Guidelines

Financial Implications

- Expense reduction can occur due to decreased cost from prevention of complications and associated increase in length of stay.
- Expense increases can occur due to increased use of prophylaxis.
